Patrick Amestoy (ENSEEIH-IRIT)
Iain Duff (CERFACS)
Abdou Germouche (Bordeaux 1)

Parallel solution phase of sparse linear systems of equations is considered in a limited memory environment. An out-of-core version of a sparse multifrontal code is presented. Two different approaches are discussed to read data from the hard disk. Scheduling for the parallel solution is described and results on the performance of the solve phase are shown. To conclude, on going and future work will be described.
