

BuildBot

OASIS4 Workshop 01.09.2010

Walter Sauf

**Max-Planck-Institut for Meteorology
Hamburg**

Max-Planck-Institut
für Meteorologie

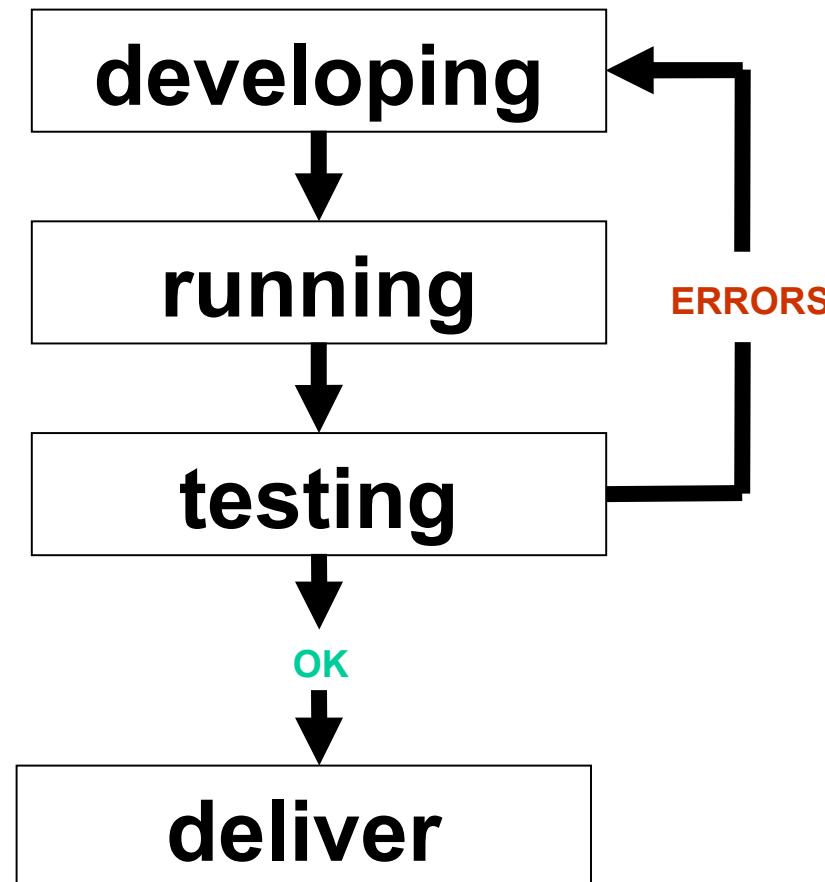

Overview

1. Motivation
2. What is BuildBot
3. Configuration BuildBot
4. BuildBots WebPages
5. Trigger a builder manual
6. Example ICON
7. Problems / Outlook

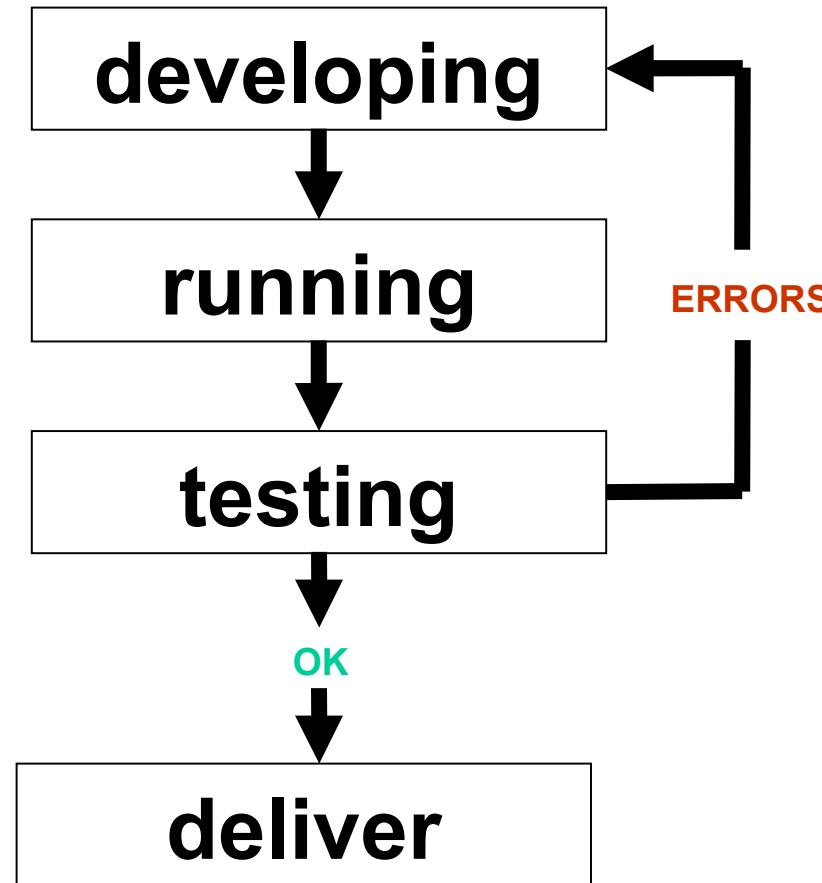

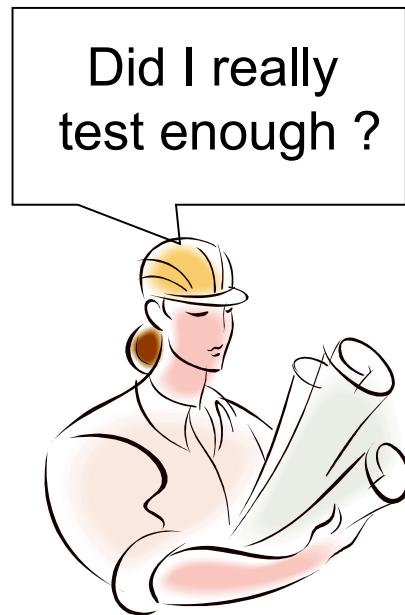

1. Motivation

Building a new Program

1. Motivation

Building a new Program

Questions

- Did I test the dependency of different compilers?
- Did I test the dependency of different systems?
- Do I get equal results using the old and new program version

Nice to have

- A tool which automatically checks the last developed version
- It should test the program on different systems
- It should test the program using different compilers or compiler options
- It should give feedback if the last test was successful or not.
- It should be easy to use.

Options

- Write a test-scripts and start it as a cronjob
- Write a program which automatically test the new versions
- Use a program like BuildBot which is developed for this job

2. What is BuildBot

It can automatically

- run a program on different computer systems.
- start a program with different parameters or program options
- test a program using different compilers or compiler-options
- compare results of different Model runs.

How does BuildBot work?

- It is divided into a server and several clients.
- Only one configuration file is needed to control a project.
- It provides a web-server to view the activity and results of the clients.
- It is written in python and should run on every system which has python (2.4.4) installed
- It is a free software project and is free of charge
- The latest version is [buildbot-0.8.1](#)

How does BuildBot work?

- On each client several **builders** can run
- It can run under a “normal” user account?
- It needs one port for the communication and one for the web server

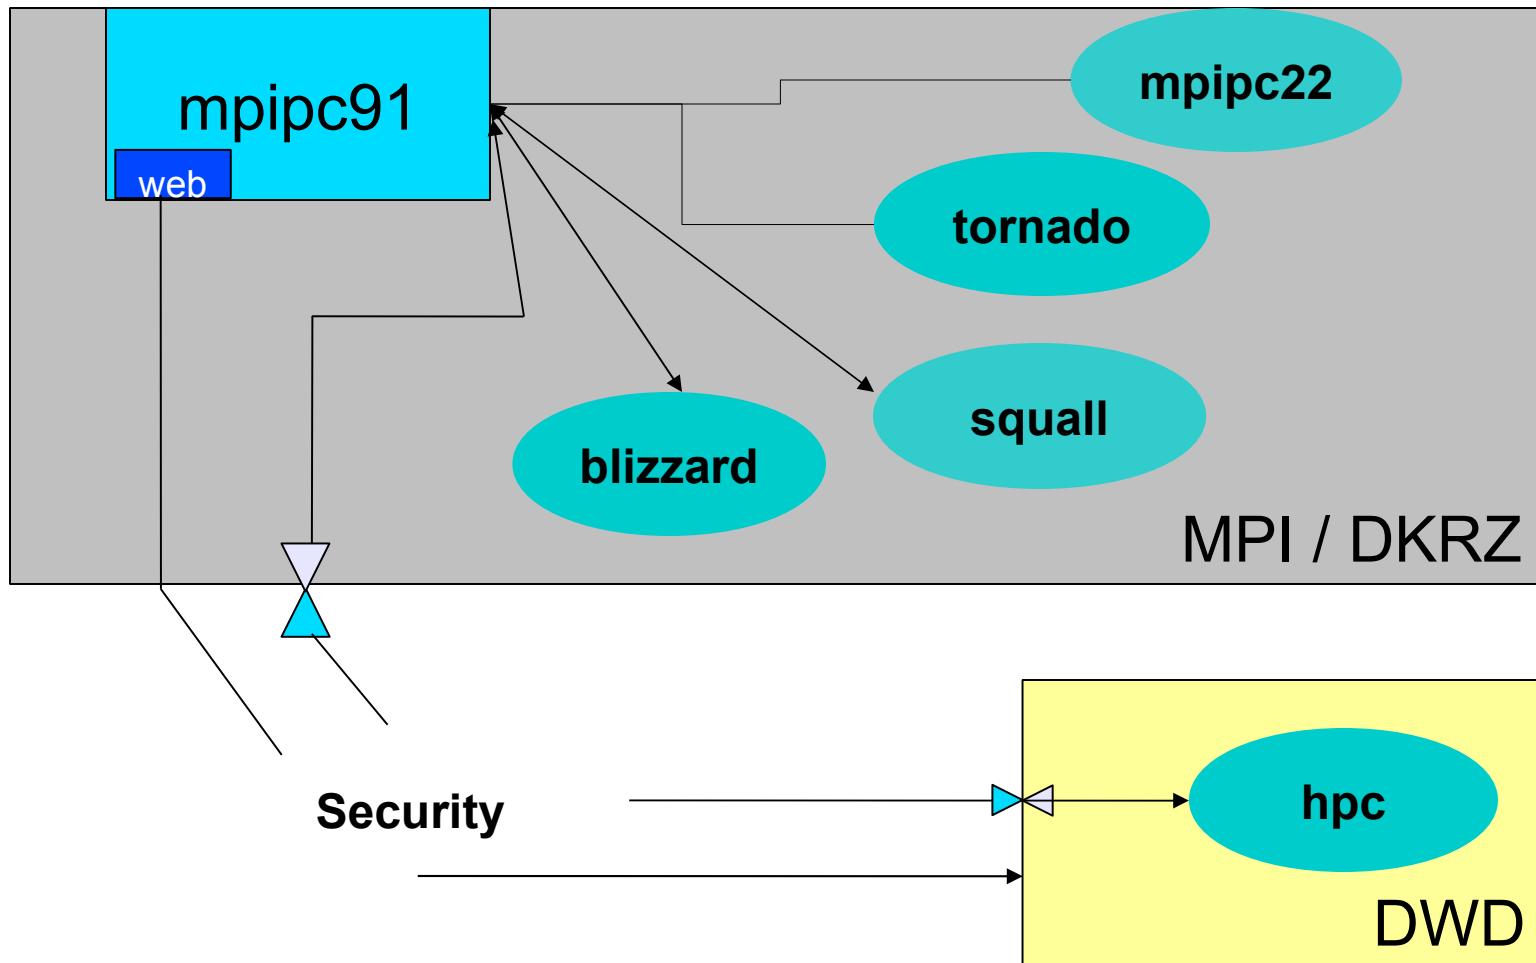

BuildBot at the MPI

- We are using version buildbot-0.7.12.
- It is installed on blizzard, tornado, squall and a Linux-PC
- A connection to the DWD is planed

BuildBot

Max-Planck-Institut
für Meteorologie

BuildBot

It can start

- builders at a special time, like each night.
- builders at each change of a repository.
- builders by triggering through the commando *buildbot with sendchange*.
- builders by triggering through the commando *buildbot with debugclient*.
- builders by triggering through the a button on the webside

BuildBot

- Can start special revisions.
- Can run locally.
- Each **builder** runs in a separate directory.
- The Server sends the commandos to the clients
- Each builder sends its logging infomation back to the Server

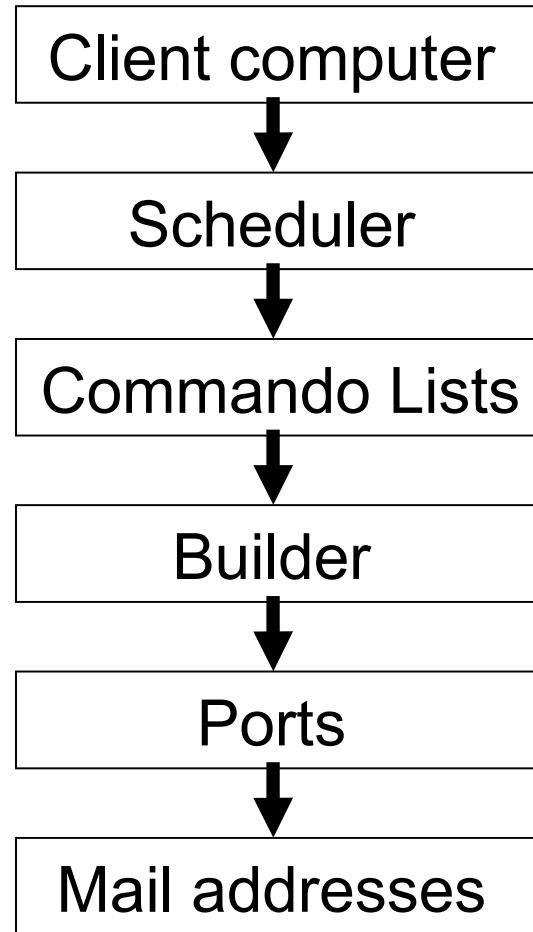

What is a **builder** doing?

- It can checkout a version from repository (SVN, CVS)
- It can call system calls
- It can set special environment variables for each **builder**
- If an error occurs in a **builder** it interrupts the execution of the commando list.
- It can stop a commando when there is no response after a wait time (deadlock)

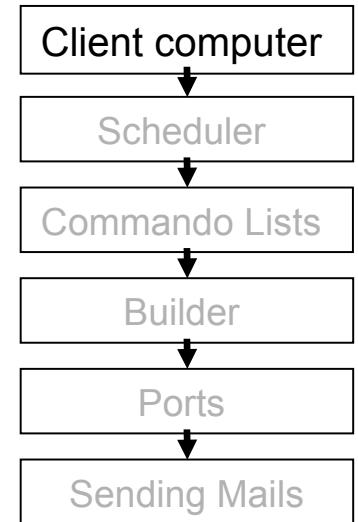

3. Configuration BuildBot

Definition of

Definition of client computer

```
c['slaves'] = [  
    BuildSlave("mpipc", "bot1keyword", max_builds=1),  
    BuildSlave("blizzard", "bot1keyword"),  
    BuildSlave("tornado", "bot1keyword"),  
    BuildSlave("squall", "bot1keyword")  
]  
)
```

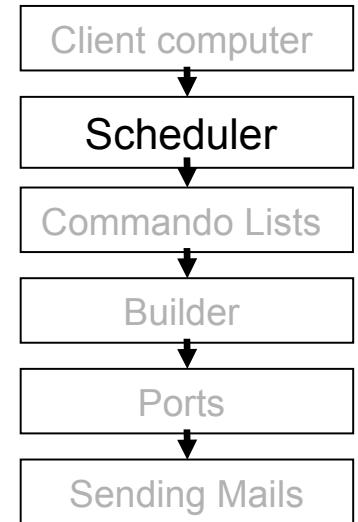

Definition of scheduler

```
s1 = AnyBranchScheduler('main',['icon-dev'],1*30,  
[ 'MPIPC_nag', 'MPIPC_gcc','BLIZZARD',  
'TORNADO_nag', 'TORNADO_gcc',  
'SQUALL_nag', 'SQUALL_gcc'  
 ]
```

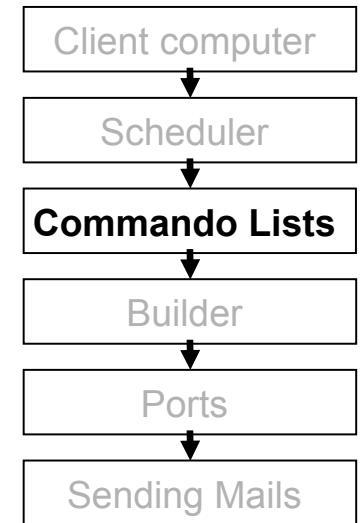

```
nightly = scheduler.Nightly(name='nightly',  
    builderNames=[  
        'MPIPC_nag', 'MPIPC_intel','BLIZZARD',  
        'TORNADO_nag',      'TORNADO_intel',  
        'SQUALL_nag','SQUALL_intel'  
    ],  
    branch='icon-dev',hour=1,minute=0)
```

```
c['Schedulers'] = [s1,nightly]
```

Commando List for diff. Sources

```
m1 = factory.BuildFactory()
m1.addStep(ShellCommand(command='rm -rf *'))
m1.addStep(source.SVN(mode='update',
    baseURL='http://svn.zmaw.de/svn/p1/trunk/',
    defaultBranch='prog'))
m1.addStep(ShellCommand(command='./configure',
    haltOnFailure=True,timeout=3600))
m1.addStep(ShellCommand(command='make',haltOnFailure=True,timeout=3600))
m1.addStep(ShellCommand(command='run',haltOnFailure=True,timeout=36000))
#
#-----#
m2 = factory.BuildFactory()
m2.addStep(ShellCommand(command='rm -rf *'))
m2.addStep(source.SVN(mode='update',
    baseURL='http://svn.zmaw.de/svn/p1/branch/',
    defaultBranch='prog'))
m2.addStep(ShellCommand(command='./configure',
    haltOnFailure=True,timeout=3600))
m2.addStep(ShellCommand(command='make',haltOnFailure=True,timeout=3600))
m2.addStep(ShellCommand(command='run',haltOnFailure=True,timeout=36000))
```

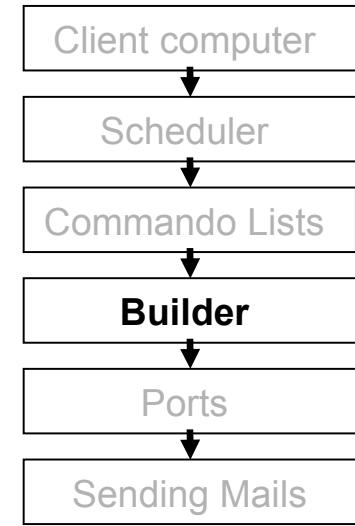

Problems and Solutions for Commando lists

- Transfer of information to the next calls
 - Read or write the information to a local file
- Loading of modules
 - Calling the “module load” in .profile
- Return Status in Scripts
 - Checking and returning the STATUS after each call
- Calling of *qsub* or *llsubmit* without sync
 - Using “-sync y” (*qsub*) or –s (*llsubmit*)

Builder

```
c['builders'] = [
    { 'name'          :'MPIPC_nag',      # builder name
      'slavename'     :'mpipc',          # Computer
      'builddir'      :'mpipc_nag',    # Builder working
      'factory'       :m1 ,             # Commando list
      'env': {'BB_SLAVE': 'slave_1'}   # Env. Variable
    },
    ..
    { 'name'          :'BLIZZARD',       # builder name
      'slavename'     :'blizzard',       # Computer
      'builddir'      :'blizzard_1',    # Builder working
      'factory'       :m2 ,             # Commando list
      'env': {'BB_SYSTEM': 'blizzard', 'BB_SLAVE': 'slave_1'}
    }
]
```

Ports

```
c['slavePortnum'] = 9988
```

```
..
```

```
..
```

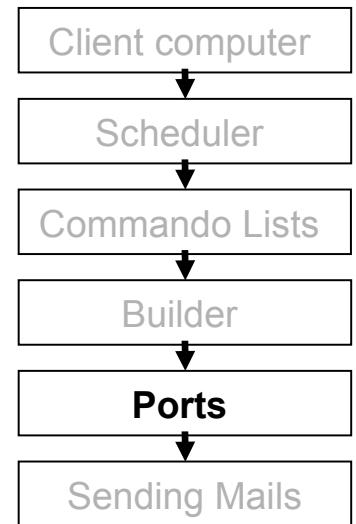

```
c['debugPassword'] = "debugKeyword"
```

```
..
```

```
c['projectName'] = "ICON"
```

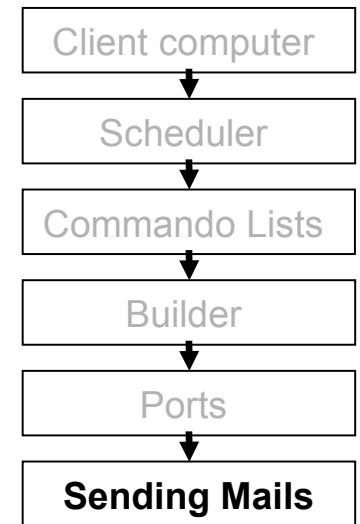

```
c['projectURL'] = "http://icon.enes.org/"
```

```
c['buildbotURL'] = http://mpipc91.mpi.zmaw.de:8011/
```

Sending Mail

```
c['status'].append(mail.MailNotifier(  
    fromaddr="BUILDBOT_ICON<sender@zmaw.de>",  
    extraRecipients=[  
        "first.add@zmaw.de"  
        ,"second.adr@zmaw.de"  
        ,"third.add@zmaw.de"  
    ],  
    mode='failing',  
    subject='[BUILDBOT ICON] %(builder)s BUILD FAILED',  
    relayhost="smtp.zmaw.de",  
    sendToInterestedUsers=False  
)
```

“buildbot.tac”

Server:

```
..  
..  
basedir = r'/scratch/local1/m211098/master_ICON'  
configfile = r'ICON.cfg'  
..  
..
```

Client:

```
..  
basedir = r'/scratch/local2/buildbot/ICON'  
buildmaster_host = 'mpipc91.mpi.zmaw.de'  
port = 9988  
slavename = 'mpipc'  
passwd = 'bot1keyword'  
....  
umask = 022  
..
```

Start of Daemons

- To start the daemons the file *buildbot.tac* is needed
- To start the daemon call
buildbot start <server directory>
- All output info is written to a logging file
- No root permission is needed

4. BuildBots WebPages

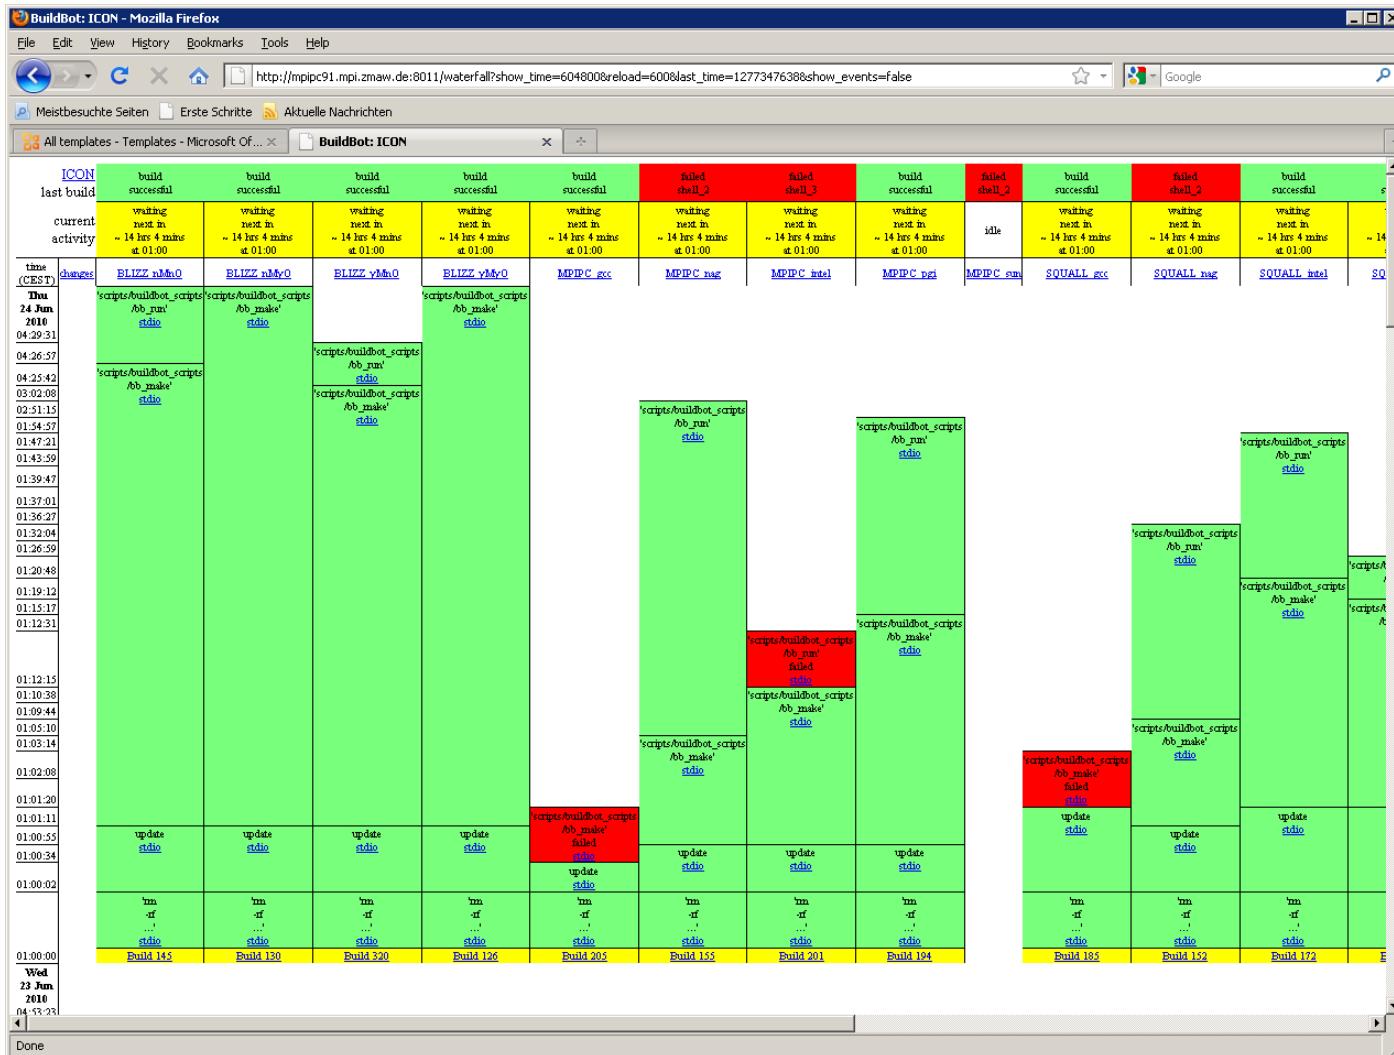

<http://mpipc91.mpi.zmaw.de:8010>

Welcome to the Buildbot!

- the [Waterfall Display](#) will give you a time-oriented summary of recent buildbot activity.
- the [Grid Display](#) will give you a developer-oriented summary of recent buildbot activity.

Logging

- Each comando writes the logging info to a file called “stdio”
- The first line of the file “stdio” contains the comando
- The next information shows all environment variables.
- After the list of environment variables the output of the comando is written

Logging

- By using qsub or llsubmit the output file is cat into the log file.

5. Trigger a builder manual

- Using *sendchange*

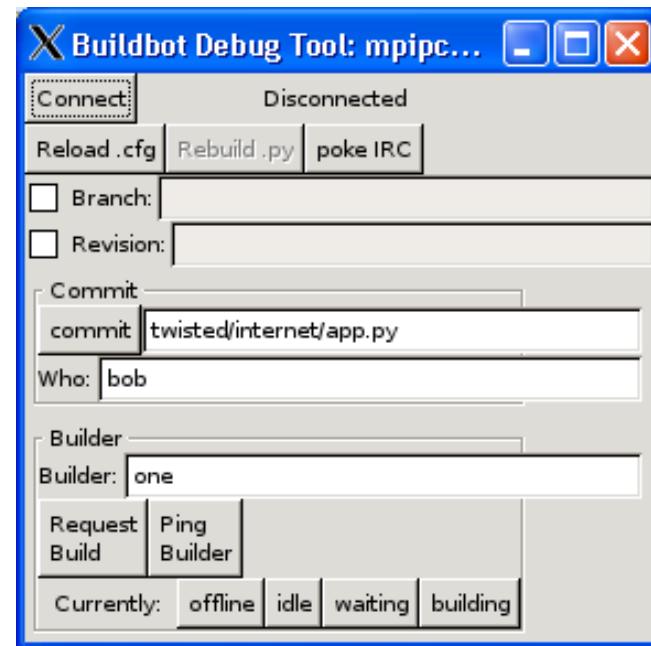

```
buildbot sendchange \  
    --master mpipc91.mpi.zmaw.de:9988 \  
    -u name \  
    -b icon-dev \  
    [-r 1234] \  
    "Testing of bb_run.new"
```

Trigger a builder manual

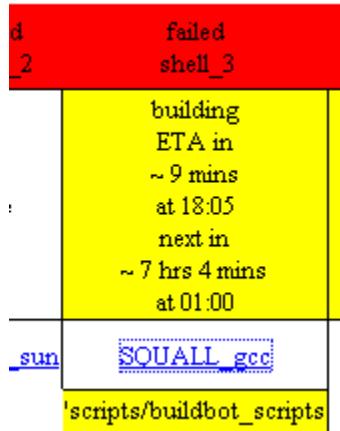

- Using the Debug Tool

```
buildbot debugclient \
-m mpipc91.mpi.zmaw.de:9988 \
-p debugkeyword
```

Trigger a builder manual

- Webpage
 - Single build
 - *allowForce=True*

Trigger a builder manual

6. Example ICON

What is a ICON **builder** doing?

1. It deletes the previous used files and directories
2. It checks out the last developed version of the project
- 3. It starts the script *bb_make***
- 4. It starts the script *bb_run***
5. If an error occurs in the build it interrupts the execution of the script.

Commando List for ICON

```
m1 = factory.BuildFactory()
m1.addStep(ShellCommand(command='rm -rf *'))
m1.addStep(source.SVN(mode='update',
                      baseURL='http://svn.zmaw.de/svn/icon/trunk/',
                      defaultBranch='icon-dev'))
m1.addStep(ShellCommand(
    command='scripts/buildbot_scripts/bb_make',
    haltOnFailure=True,timeout=36000))
m1.addStep(ShellCommand(
    command='scripts/buildbot_scripts/bb_run',
    haltOnFailure=True,timeout=36000))
```

ICON Builders

```
c['builders'] = [
    {'name'          :'MPIPC_nag',
     'slavename'    :'mpipc',
     'builddir'     :'mpipc_nag',
     'factory'      :m1 ,
     'env': {'BB_SYSTEM': 'mpipc', 'BB_SLAVE': 'mpipc_nag'}
   },
   ..
   { 'name'          :'BLIZZ_nMnO',
     'slavename'    :'blizzard',
     'builddir'     :'blizz_nMnO',
     'factory'      :m1 ,
     'env': {'BB_SYSTEM': 'blizzard', 'BB_SLAVE': 'blizz_nMnO'}
   }
]
```

Scripts

- Both scripts *bb_make* and *bb_run* are included in the repository.
- The control of system and compiler is done by analyzing the variables **BB_SYSTEM** and **BB_SLAVE**

bb_make

- The script creates the model binary
- It loads the needed Modules
- *qsub* and *llsubmit* are not used
- It calls the parts
 - configure
 - make
 - make index

Environment variables for BB_SLAVE

	Compiler				
	PGI	Sun	GCC	NAG	INTEL
mpipc	mpipc_pgi	mpipc_sun	mpipc_gcc	mpipc_nag	mpipc_intel
tornado	tornado_pgi	tornado_sun	tornado_gcc	tornado_nag	tornado_intel
squall	squall_pgi	squall_sun	squall_gcc	squall_nag	squall_intel

	MPI Setting				
	no MPI no OpenMP	no MPI yes OpenMP	yes MPI no OpenMP	yes MPI no OpenMP	
blizzard	blizz_nMnO	blizz_nMyO	blizz_yMnO	blizz_yMyO	

bb_make

```
#=====
# configure the Makefile and make the executables

./target_confmake.ksh ${BB_SLAVE}

# stop if not ok

check_error $? "bb_make: ./target_confmake.ksh ${BB_SLAVE}"

#=====
```

bb_run

- The script is divided into a “model loop” and a “post processing loop”
- The “model loop” looks for files starting with **exp.t** (like: exp.test_hat_jww), and starts it.
- The “post processing loop” looks for files starting with **post_** (like: **post_hat_jww.bash**), and starts it.
- If possible *qsub* and *llsubmit* are used

bb_run

```
if [ "$1" != "" ]      # --> from argument
```

```
then
```

```
    target="$1"
```

```
    source="argument"
```

```
elif [ "$BB_SLAVE" != "" ] then
```

```
    target="$BB_SLAVE"
```

```
    source='$BB_SLAVE'
```

```
else                  # --> as default
```

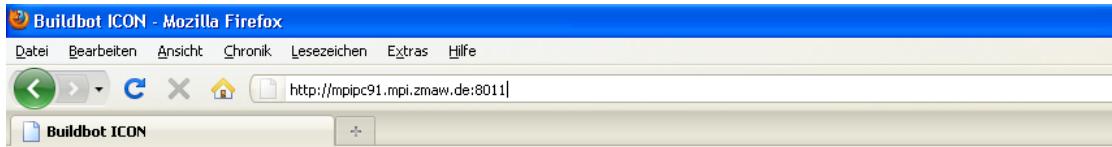

```
    target="default"
```

```
    source="$scriptname"
```

```
fi
```

Web Main Page Icon

Buildbot for ICON

Buildbot starts every night a test suite on different machines, using different compilers.

The test consists in:

1. removing files from the previous test
2. retrieving the most recent revision existing on "trunk/icon-dev"
3. running "configure&make" for a specified target machine and compiler
4. making test runs with the following sub steps:
 - i. make run scripts for the target machine and for all experiments, for which descriptor files named run/exp.test_* exist
 - ii. launch the test run scripts
 - iii. launch existing post processing scripts, named run/post_*

The success (in green) or failure (in red) of these tests is displayed on the following pages:

- [Waterfall display](#): Displays success/failure for all 4 steps listed above for all build targets, in chronological order.
- [Grid display](#): Displays overall success or failure for the 20 most recent revisions tested by Buildbot, including regular nightly builds and
- [Latest build](#): Displays the overall success or failure for the last test of each builder, ordered by builder.
- [List display](#): Displays the overall success or failure of the most recent builds, ordered by time of completion of the build tests.
- [Build slaves](#): Displays the status of all machines used by this Buildbot.

Postprocessing results are displayed here in comparison to a reference result from an earlier revision:

- [exp.test_hat_jww](#)

About Buildbot

- [Buildbot home page](#)
- [Buildbot version used](#)

Model compare

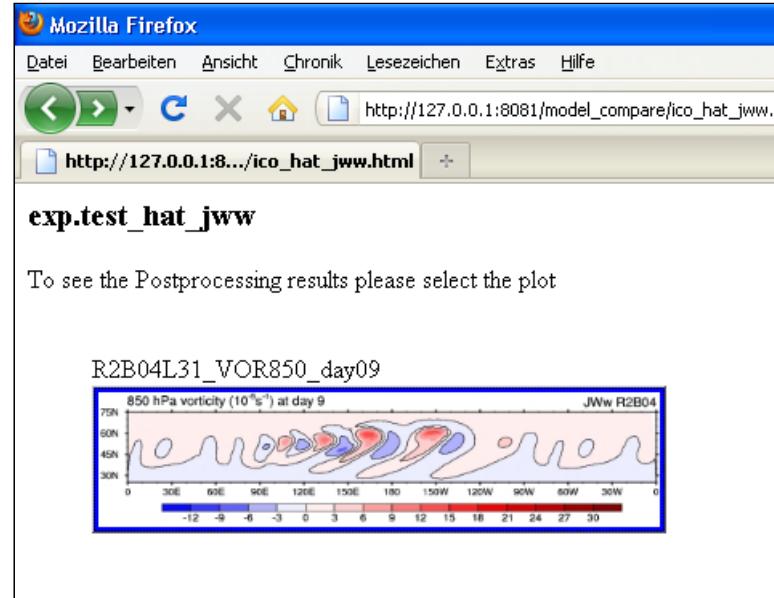

- To have the possibility to compare the model output each run creates a graph (postprocessing loop).
- Each graph is collected and stored on the Server computer using a cronjob.
- The collection is done each hour.
- The cronjob creates a html-page to show each graph on one web-page.
- At the button of the web-page a link to the result of the day before can be found.
- In the future more experiment results can be included.

Model compare

Postprocessing results are displayed here in comparison to a reference result from an earlier revision:

7. Problems

- The RETURN Status of a *lbsubmit* call is always “OK”, but it can be not OK!
- If “*allowForce*” is set to “*False*” stopping of a running builder is not possible.
- If “*allowForce*” is set to “*True*” each user from the institute can trigger a builder.
- After a restart of the system a manual restart of client or server has to be done

Outlook

- Following BuildBot are running
 - ECHAM (mpipc91.mpi.zmaw.de:8010)
 - Compiler: GCC, NAG, INTEL, PGI, SUN
 - Systems: blizzard, tornado, squall, mpipc22
 - ICON (mpipc91.mpi.zmaw.de:8011)
 - Compiler: GCC, NAG, INTEL, PGI, SUN
 - Systems: blizzard, tornado, squall, mpipc22
 - COSMOS (mpipc91.mpi.zmaw.de:8012)
 - Models: asob, aso, as, ob, s
 - Systems: blizzard, tornado
