Foreword by Iain S. Duff **3**

Preface **5**

General Presentation **9**

Notations **15**

1 Computability in finite precision **17**
1.1 Well-posed problems 17
1.2 Approximations 18
1.3 Convergence in exact arithmetic 18
1.4 Computability in finite precision 22
1.5 Gaussian Elimination 26
1.6 Forward error analysis 28
1.7 The influence of singularities 36
1.8 Numerical stability in exact arithmetic 39
1.9 Computability in finite precision for iterative and approximate methods 40
1.10 The limit of numerical stability in finite precision 43
1.11 Arithmetically robust convergence 45
1.12 The computed logistic 47
1.13 Bibliographical comments 51

2 Measures of stability for regular problems **53**
2.1 Choice of data and class of perturbations 54
2.2 Choice of norms: scaling 54
2.3 Conditioning of regular problems 58
2.4 Simple roots of polynomials 60
2.5 Factorizations of a complex matrix 63
2.6 Solving linear systems 64
2.7 Functions of a square matrix 66
2.8 Concluding remarks 71
2.9 Bibliographical comments 72

3 Computation in the neighbourhood of a singularity 73
3.1 Singular problems which are well-posed 73
3.2 Condition numbers of Hölder-singularities 74
3.3 Computability of ill-posed problems 76
3.4 Singularities of $z \longmapsto A - zI$ 77
3.5 Distances to singularity 82
3.6 Unfolding of singularity 86
3.7 Spectral portraits 87
3.8 Bibliographical comments 87

4 Arithmetic quality of reliable algorithms 89
4.1 Forward and backward analyses 89
4.2 Backward error 89
4.3 Quality of reliable software 91
4.4 Formulae for backward errors 92
4.5 Influence of the class of perturbations 97
4.6 Iterative refinement for backward stability 101
4.7 Robust reliability and arithmetic quality 103
4.8 Bibliographical comments 104

5 Numerical stability in finite precision 105
5.1 Iterative and approximate methods 105
5.2 Numerical convergence of iterative solvers 106
5.3 Stopping criteria in finite precision 107
5.4 Robust convergence 109
5.5 The computed logistic revisited 113
5.6 Care of use 114
5.7 Bibliographical comments 114

6 Software tools for round-off error analysis in algorithms 117
6.1 A historical perspective 117
6.2 The assessment of the quality of the Numerical Software 118
6.3 Backward error analysis in Libraries 119
6.4 Sensitivity analysis 120
6.5 Interval analysis 120
6.6 Probabilistic models 121
6.7 Computer algebra 122
6.8 Bibliographical comments 122

7 The toolbox PRECISE for computer experimentation 123
7.1 What is PRECISE ? 124
7.2 Module for backward error analysis 126
7.3 Sample size 136
7.4 Backward analysis with PRECISE 137
7.5 Dangerous border and unfolding of a singularity 143

7.6 Summary of module 1 146
7.7 Bibliographical comments 147

8 Experiments with PRECISE **149**
8.1 Format of the examples 149
8.2 Backward error analysis for linear systems 151
8.3 Computer unfolding of singularity 163
8.4 Dangerous border and distance to singularity 167
8.5 Roots of polynomials 172
8.6 Eigenvalue problems 178
8.7 Conclusion 185
8.8 Bibliographical comments 186

9 Robustness to nonnormality **187**
9.1 Nonnormality and spectral instability 187
9.2 Nonnormality in Physics and Technology 193
9.3 Convergence of numerical methods in exact arithmetic 194
9.4 Influence on Numerical Software 196
9.5 Bibliographical comments 202

10 Qualitative Computing **203**
10.1 Sensitivity and pseudosolutions for $F(x) = y$ 204
10.2 Pseudospectra of matrices 205
10.3 Pseudozeroes of polynomials 212
10.4 Divergence portrait for the complex logistic iteration 217
10.5 Qualitative computation of a Jordan form 218
10.6 Beyond linear perturbation theory 223
10.7 Bibliographical comments 227

11 More numerical illustrations with PRECISE **229**

Annex : the toolbox PRECISE for MATLAB **241**

Index **251**

Bibliography **255**
